

Identifying early warning signs of mental health issues among nursing home and home care assistants using data science techniques

Chizurum Nwachukwu

Programme: MSc by Research School of Science and Technology

Email: CN693@live.mdx.ac.uk

Introduction

- Burnout among UK care workers is a major issue that contributes to the adult social care crisis and high staff turnover.
- This project aims to use data science to predict early signs of burnout in care workers and support intervention through a digital tool.

Acknowledgments

I want to thank Prof. Juan Carlos Augusto and Dr Mark Springett who are currently supervising this research.

Methodology

- Literature review: Initial approach
- Analysing smartwatch data physiological stress indicators from careworkers.
- Interviewing careworkers
- Surveys including the Oldenburg Burnout Inventory.
- Creation of a web application that predicts early signs of burnout and addresses the needs of careworkers.

Next Steps

- Collect feedback on design of system interface
- Conduct interviews with recruited careworkers
- Analysing smartwatch data
- Develop prototype of web application
- Collect feedback

Achievements

- Ethical Approval
- Surveys have been designed and distributed
- Recruitment of careworkers with smartwatches for interviews
- Design of system interface

Web App User Interface

System Architecture
